From Data to Decisions: The 2025 Sales Story

Business story report | ApexPlanet Internship, Task 4

1. Executive summary

The business earned **₹139.4M** from **1,000** orders placed by **947** customers in 2025. Electronics is the largest category (36% of revenue). A hypothesis test asked whether Electronics orders are significantly larger than Fashion orders: the answer is **not at the 5% level** ($p = 0.061$), so Electronics' lead comes from **order volume**, not larger orders. The clearest opportunities are **customer retention** (only 5% of customers reorder) and the **August–September dip**.

2. Dataset and cleaning

The dataset has 1,000 orders and 12 columns covering 2025-01-01 to 2026-01-01. Quality checks and actions:

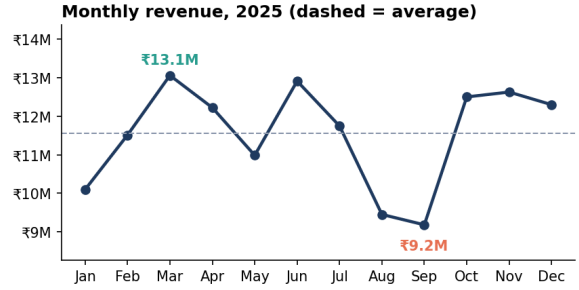

Issue	Records	Action
Missing Age	20	Filled with median age
Missing City	13	Labelled 'Unknown'; excluded from city ranking
Order_ID ORD100050 reused for different orders	9	Kept as distinct orders and flagged
Fully duplicated rows	0	None found
Total_Sales = Quantity × Unit_Price	1,000 of 1,000	Verified
Partial month (1 Jan 2026)	5 orders	In totals; excluded from monthly trend

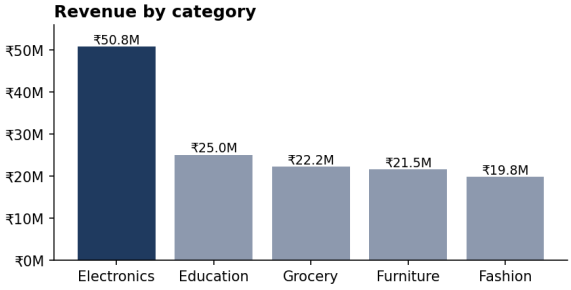

3. Key performance indicators

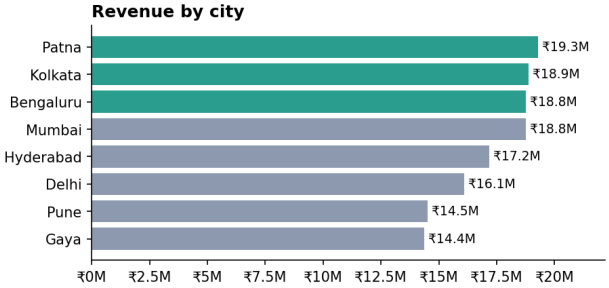

KPI	Value
Total revenue	₹139.4M
Orders / customers	1,000 / 947
Average / median order value	₹139.4K / ₹108.6K
Units sold	5,435
Top category / city / product	Electronics / Patna / Laptop
Repeat customer rate	5%

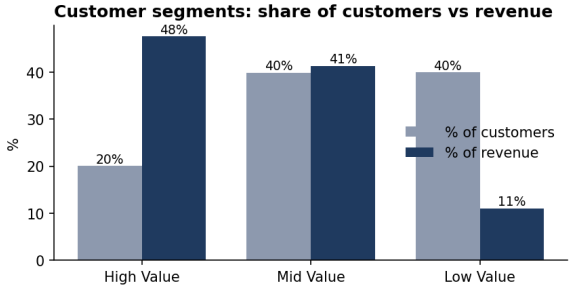

ApexPlanet Sales Dashboard Summary (2025)

₹139.4M	1,000	₹139K	947
Total revenue	Orders	Avg order value	Customers

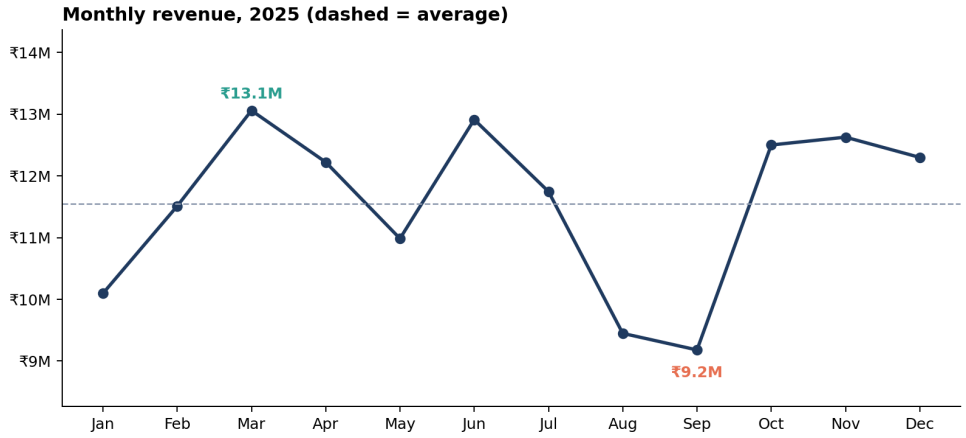

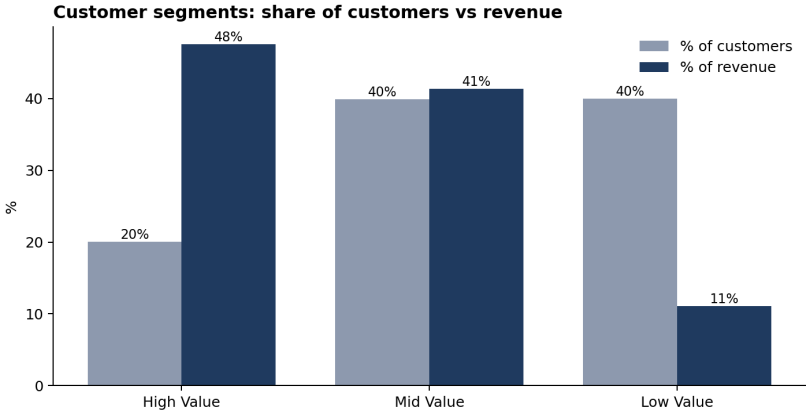

4. Sales trend

Monthly revenue averaged ₹11.5M, peaking in March (₹13.1M) and bottoming in September (₹9.2M, 21% below average). Revenue recovered from October.

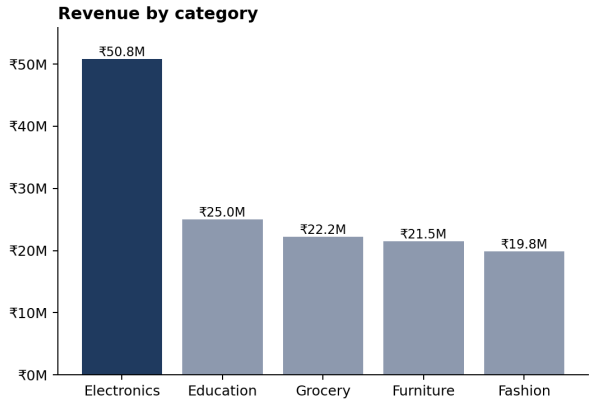

5. Customer analysis

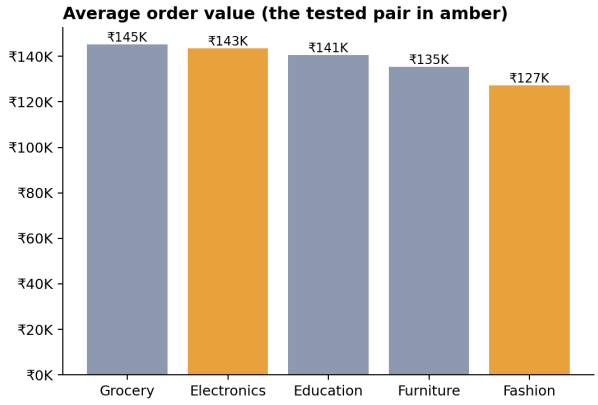

Customers were segmented by lifetime spend. The **High Value** segment (190 customers, 20%) generates 48% of revenue, while the **Low Value** segment (40% of customers) generates only 11%. Because 95% of customers bought once, growth depends on retention.

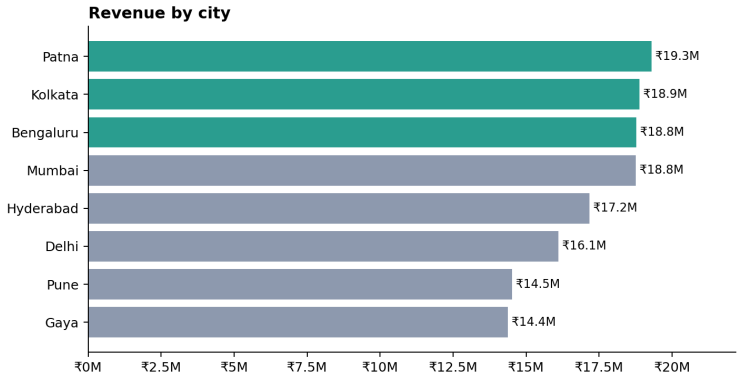

6. Product and market performance

Electronics earned ₹50.8M from 354 orders (two products, Laptop and Mobile). Every other category is a single product, so category revenue largely tracks order count; average order value is similar everywhere (ANOVA p = 0.58). Top cities Patna, Kolkata, Bengaluru and Mumbai are within ₹0.5M of each other; Gaya and Pune trail.

7. Statistical validation

H0: mean order value (Electronics) = Fashion. **H1:** Electronics > Fashion. Welch t = 1.55, df = 329, **p = 0.061**; difference ₹16.3K (12.8%), 95% CI −₹4.3K to ₹36.9K. **Decision: Fail to reject H0** at α = 0.05. See the Hypothesis Test Report for details.

8. Recommendations and expected impact

Recommendation	Evidence	Expected impact (illustrative)
Retain high-value customers: loyalty offers, reorder reminders	20% of customers give 48% of revenue; 5% repeat rate	Repeat rate 5% to 10% adds about ₹6.6M (+4.7%)
Run promotions in August and September	₹9.4M and ₹9.2M vs ₹11.5M average	Reaching the average in both months adds about ₹4.5M
Back Electronics through volume, not price assumptions	Lead is order count; order-size gap not significant	Avoids unproven premium pricing; re-test with more data
Grow Pune	High AOV (₹146.6K) but only 99 orders	Matching top-3 city volume adds about ₹4.5M

9. Conclusion

Revenue is healthy and Electronics leads, but the data does not prove Electronics orders are larger than Fashion orders. The evidence-backed levers are retention, the late-summer dip and under-penetrated cities. Impact figures are illustrative scenarios, not forecasts.
